                                                                                                                                                                                                                                                                                                                                                 엄
                                                                                                                                                                                                                                                       AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and disapnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

The present invention describes a method which comprises making a high-density gene chip, specifically for making high-density micro-array of oligonucleotide probes. An oligonucleotide probe selecting process to seek preferentially length variable and coverage variable probes is provided to ensure identical cross melting temperature of probes is provided to ensure identical cross melting temperature of probes is provided to make the cross control of gene chip relatively simple and raise the reliability of the gene chip detecting results. The process proposes a specific probe selection method for and non-specific sites and a probe overall arrangement scheme. AAA79738 to AAA80201 represent oligonucleotide probe sequences which are used in examples from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human angiotensin-converting enzyme (ACE) PCR primer, SEQ ID NO:36.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Angiotensin-converting enzyme gene; ACE; polymorphism; polymorphic marker; cardiovascular disease; myocardial infarction; unstable angina; hypertension; atherosclerosis; stroke; prognosis; drug screening; treatment outcome; human; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Assessing cardiovascular status in humans involves comparing test polymorphic pattern comprising polymorphic positions within genes encoding specific proteins, with reference polymorphic pattern.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

Creatment regiment compitating administration of actual observations, beta-adrenergy receptor antagonists (beta-colockers) or calcium channel blockers). One or more polymorphic markers blockers a basis for predicting the outcome of a treatment regimen. Fragments of the genes comprising a polymorphic site may be used as primers and probes for detecting genetic polymorphisms or in molecular primers and probes for detecting genetic polymorphisms or in molecular primers arrays for high throughput screening. The genes, and the proteins chey encode are useful in the screening of potential cardiovascular chey encode are useful in the screening of potential cardiovascular chiminates trial and error in selecting a treatment for a particular individual cardiovascular patient. It also provides the ability to eliminate patients from clinical trials who are predicted to be noncresponsive, or at a risk for an adverse response, to a particular creatment regime. Adverse results in an early trial can be evaluated to definity polymorphic patterns so that the adverse results can be correlated with a sub-population of the test population, permitting exclusion of such sub-populations from the treatment group. Beneficial drugs can be approved for use in the appropriate population, thereby the number of patients required group cardior actival, which in the decreasing the number of patients required secured the encounter of patients and the secure of patients required to a clinical trial, which in
  The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACE), angiotensin II receptor type 1 (ATI) and type 2 (ATZ), angiotensinogen (ACT), renin, aldosterone synthase, endothelin receptor type A and beta-adrenergic receptors 1 and 2. The method comprises determining the sequence at one or more polymorphisms from the individual with a reference polymorphic pattern obtained from a population of individuals exhibiting a pattern obtained cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual action, unstable angina, hypertension, atherosclerosis and stroke. They are also useful for predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient fiven a production treatment regiment regiment regiment regiment regiments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     turn decreases the duration and cost of such trials. Sequences AAA38201-A38239 represent PCR primers used in an exemplification of the invention to amplify short fragments of the human ACB gene (AAA38328- AAA38330) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention is related to methods for determining the polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. THe PCR primers shown in sequences AAC61201-C61371 were all used to demonstrate the
                                                                                                                             Assessing disease status in individual by determining sequence(s) at one or more polymorphic positions within the human genes encoding the protein(s) involved in physiological pathway associated with treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cell comprising exogenous nucleic acid inducing tyrosine hydroxylase expression useful for treating catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat; Nurr1; tyrosine hydroxylase; catecholamine-related disease;

sequences. The Nurrl protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurrl gene and protein can be used in the treatment of catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New radiation hybrid map of the dog, Canine familiaris, genome, useful for e.g. identifying genes implicated in phenotypic and behavioral traits or in genetic diseases and for studying dog pedigrees.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA6642. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (corresponsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Dog; genome; genomic marker; radiation hybrid map; identification; chromosome location; gene marker; polymorphic microsatellite marker; phenotype; behaviour; pedigree; ss.

The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (c.c. or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes
                                                                                                                                                                                                                                                                                                                                                                                                                                   genome, useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAH753
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to antisense compounds 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic translational termination region or 3'-untranslated region of a nucleic acid encoding a p188 mitogen activated protein kinase (MAPK), where the artisense oligonucleotides inhibit the expression of MAPK. Sequences AAC79510 represent human p1881pha MAPK and p38beta MAPK cDNA sequences. AAC79510 and AAC79513 - AAC79510 represent human p1881pha antisense oligonucleotides, while AAC79502 - AAC7951 and AAC7951 and AAC79571 - AAC79510 represent human p1881pha antisense oligonucleotides while AAC79537 and antisense oligonucleotides AAC79534 - AAC79577 and antisense oligonucleotides AAC79534 - AAC79537 and antisense oligonucleotides have antitheumatic; antiarthritic; che antisense oligonucleotides have antitheumatic; antiarthritic; coligonucleotides are useful for inhibiting the expression of p38 MAPK in cells or tissues. The oligonucleotides are useful for inhibiting the expression of p38 MAPK in cells or thearthis, or heart disease. The oligonucleotides are also useful for inhibiting inflammatony or autoimmune diseases e.g. rheumatoid arthritis, or heart disease. The oligonucleotides are also useful for inhibiting inflammation or apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò

PCR primers AAF55055-56 were used to amplify a fragment of the Mumps CC virus genome. The amplified fragment was used in the course of the invention. The specification describes a method for producing a recombinant mumps virus. The method comprises transfecting or transforming, in a rescue composition media, a host cell with a cream comprising a genome or antigenome of mumps virus, transcription vector encoding trans-acting proteins (NP, P and L) concessary for encapsidation, transcription and replication. The method is carried out under conditions sufficient to permit the co-expression of carried out under conditions sufficient to permit the co-expression of carried out under condition of the recombinant virus. The recombinant virus has an ability to induce long-lasting immunity with a single dose and a relatively low level of genome recombination. The recombinantly composition and therapeutic applications, cell targeting, gene therapy, mutant virus preparation and immunogenic composition preparation. The method may also produce an attenuated virus for use as a vaccine for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing a recombinant mumps virus (MUV), useful as a mumps vaccine, by transfecting or transforming a host cell with a transcription vector comprising a MUV genome or antigenome, and an expression vector encoding trans-acting proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotide; inducible nitric oxide synthase; NOS; modulate expression; immunomodulator; antidiabetic; cardiovascular; cardiant; neuroprotective; vasotropic; ischaemia; reperfusion injury; 2'-O-methoxyethyl; phosphorothioate; mouse; ss.

The invention relates to antisense compounds, especially oligonucleotides, which are targeted to a nucleic acid encoding inducible nitric oxide synthase and which specifically hybridise to and modulate expression of inducible nitric oxide synthase. The antisense compounds have immunomodulator, antidiabetic, cardiovascular, cardiant, coligonucleotides are useful for inhibiting the expression of inducible of nitric oxide synthase in calls or itssues. In particular, the antisense oligonucleotides are useful for treating diseases or disorders associated with inducible nitric oxide synthase, e.g. diabetes, immunological clisoner, cardiovascular disorder, neurological disorder, cardiovascular disorder, neurological disorder, cardiovascular disorder, neurological disorder or ischaemia/reperfusion injury. The antisense oligonucleotides are also useful for research and diagnostics. The present sequence is that of an antisense 2'-O-methoxyethyl appmer oligonucleotide with a phosphorothoate backbone, a central "app" region of ten nucleotides continue the oligonucleotide. The antisense continue residues throughout the oligonucleotide. The antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides for modulating the expression of inducible nitric oxide synthase in cells or tissues, particularly useful for treating e.g. immunological, cardiovascular or neurological disorders, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chylcytidine residues throughout the oligomucieotide. The antisense ignucleotide is targeted to mouse inducible nitric oxide synthase (NOS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human hnRNP Al phosphorothioate antisense oligonucleotide, SEQ ID NO:48.

Sequences AAC92738-C92817 represent antisense oligonucleotides targetted to the heterogeneous nuclear ribonucleoprotein A1 (hnRNP A1) gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human hnRNP A1 mRNA, and were analysed for their effect on hnRNP A1 mRNA and were analysed for their effect on hnRNP A1 mRNA lavels by quantitative real-time PCR. hnRNP A1 (also known as heterogeneous nuclear ribonucleoprotein core protein A1 and p40CRS) is thought to function in the stabilisation, transport and processing (including alternative splicing) of newly synthesised mRNAs. It facilitates the annealing of single-stranded nucleic acids, modulates the binding of snRNPs to RNA intron sequences, and shuttles continuously between the nucleus and the cytoplasm acting as a carrier protein for mRNAs. hnRNP A1 also participates in telomere biogenesis, with low levels of hnRNP correlating with shortened ctolomeres. In addition, hnRNP A1 has also been classified as an apoptosis control splicing events, particularly donor splice site selection, hnRNP A1 is implicated in the process of concogenesis. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with hnRNP A1 expression, such as cancer Novel antisense compound targeted to human hnRNP Al which specifically hybridizes with and inhibits the expression of human hnRNP Al, useful for modulating the expression of hnRNP Al in cells. donor splice site selection, telomere biogenesis, oncogenesis, apoptosis-associated protein, cancer, tumour formation, expression inhibition; phosphorothicate, antisense oligonucleotide, MRNA processing; transport; stabilisation; alternative splicing; 0.8%; Score 13.4; DB 1; Length 20; 93.3%; Pred. Sequences AAC92738-C92817 represent antisense oligonucleotides targetted to the heterogeneous nuclear ribonucleoprotein A1 (hnRNP A1) gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human hnRNP A1 mRNA, and were analysed for their effect on hnRNP A1 mRNA PA wents by quantitative real-time PCR. The human hnRNP A1 mRNA real sequences in core in the standard pages of the human hnRNP A1 mRNA real sequences in the standilisation, transport and packes is thought to function in the stabilisation, transport and packes is thought to function in the stabilisation, synthesised mRNAs. It facilitates the annealing of single-stranded synthesised mRNAs. It facilitates the annealing of single-stranded or nucleic acids, modulates the binding of smRNPs to RNA intron sequences, and shuttles continuously between the nucleus and the cycoplasm acting as a carrier protein for mRNAs. hnRNP A1 also participates in telomere to biogenesis, with low levels of hnRNP correlating with shortened to the basis that it is specifically cleaved into three fragments during antibody-mediated apoptosis. Due to its ability to control splicing events, participalarly donor splice site selection, hnRNP A1 is implicated in the process of concogenesis. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with hnRNP A1 expression, such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Adrenomedullin; AM; factor H; AM binding protein; heart disease; sepsis; pulmonary disease; liver cirrhosis; cancer; diabetes; inflammation; tumour; PCR primer; ss; mouse.
                                                                                                                                                                                                                                                                                                                                                                                      Novel antisense compound targeted to human hnRNP Al which specifically hybridizes with and inhibits the expression of human hnRNP Al, useful for modulating the expression of hnRNP Al in cells.

Amethod for measuring adrenomedullin (AM) levels in a sample, comprises incubating the sample with a chaotropic agent to dissociated AM and factor H. After dissociation, the sample is fractionated to obtain a garden or peptide fraction, and the AM levels in the peptide fraction are constituted. The method for measuring AM levels, particularly circulating AM levels, is useful for disease diagnosis, for determining diseases of severity, and for following the course of treatment of diseases include contacterised by altered or abnormal AM levels. These diseases include heart diseases, pulmonary diseases, liver cirrhosis, cancer, diabetes, csepsis, and inflammation. AM-binding proteins such as factor H, are cspsis, and inflammation. AM-binding proteins such as factor H, are particularly those diseases associated with abnormally elevated AM particularly those diseases characterised by altered concentrations of circulating AM. Poptides derived from factor H may be concentrations of circulating AM. Poptides derived from factor may be concentrations of circulating AM. Poptides derived from factor of used as therapeutics for the inhibition of growth and proliferation of cancer or tumour cells, including urinary bladder, urethral, renal, rectal, colon, small intestine, gastric, oesophageal, salivary gland, cancer or tumour cells, including urinary bladder, urethral, renal, rectal, colon, small intestine, gastric, oesophageal, salivary gland, cancer or kin, lung, and brain cancers. The present sequence represents a PCR primer specific for the murine factor H gene. The primer is used to confirm the expression of the factor H gene in murine pancreas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; 5-hydroxytryptamine receptor 1B; HTR1B; serotonin; gene therapy; therapeutic; forensic application; migraine; neurological disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Forward PCR primer used for sequencing fragment 5 of human HTR1B gene.

between a trait and at least one genotype or haplotype of HTR1B is useful for developing tests and therapeutic treatments for migraine and other neurological disorders. It is also used in gene therapy. The present DNA sequence is a forward PCR primer which is used for sequencing fragment 5 of HTR1B gene. This primer corresponds to 1242-1261 bases of the HTR1B
                                                                                                                                                                                                                            The patent discloses a polynucleotide comprising one or more of 3 novel single nucleotide polymorphisms in the human 5-hydroxytryptamine (serotonin) receptor IB (HTRIB) gene. The polymorphic variant comprises at least one polymorphism selected from guanine at PS1, thymine at PS2, and adenine at PS4, or adenine at position corresponding to nucleotide 540. The HTRIB gene is useful for therapeutic purposes. It is useful in studying the expression and biological function HTRIB, as well as in developing drugs targetting this protein. It is also useful in the developing drugs targetting this protein. It is also useful in the contraction of the second of an association of the second of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20 BP; 3 A; 7 C; 6 G; 4 T; 0 U; 0 Other;

The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microorganisms e.g. algae, archaea, bacteria, fungi and parasites, for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (I) obtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the detection of a least one antimicrobial agent resistance gene or at least one toxin gene. hexA nucleic acids are used for the specific and ubiquitous detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapoutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group which can be detected include Abiotrophia adiacens. Bordetella sp., Corynebacteriaceae family. Pseudomonads group, Streptococcus sp., Neisseria gonorrhoeae and Staphylococcus sp., Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002104 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention

```
The invention relates to a method for screening for a gene or gene product associated with endometriosis. The method comprises comparing the pattern of gene expression in a diseased endometrion fiscue from a patient suffering from endometriosis to the pattern of gene expression in healthy endometrium tissue from the same patient, and selecting a gene comparing the manufacture of expression differs between healthy and diseased tissues. The gene, gene product and their antagonists and agonists are useful in the manufacture of a medicament for diagnosing or treating endometriosis. The method is useful for screening genes or gene products that are important of the method in endometriosis. It is particularly useful in diagnosing endometriosis, as well as for screening for agents for treating endometriosis. Prior methods of diagnosing endometriosis are more difficult to perform and are more expensive, normally involving surgery. The present method allows the disease to be diagnosed and treated at earlier stage. The present sequence is a primer used in a reverse transcription polymerase chain reaction (RT-PCR) procedure to validate the results of differential gene expression studies. It was used to amplify human endometrium cDNA encoding cathepsin D
                                                                                           Screening for a gene or gene product associated with endometriosis, for diagnosing or treating endometriosis, comprises selecting a gene whose level of expression differs between healthy and diseased endometrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MDH31; MDH2; malic acid dehydrogenase; Krebs cycle; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New PCR primer composition comprising primers MD31 and MD42 that specifically amplifies a DNA of Salmonella typhimurium, useful for detecting the presence of S. typhimurium in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.8%; Score 13.4; DB 1; Length 20; 33.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                                         The invention relates to protein kinase stress-related protein (PKSRP)

C useful for increasing stress-tolerance in plants, obtained from

C byscomitrella patens: The PKSRP protein is salected from receptor

C protein kinases (RMFK), receptor-like kinases (RLK), calcium dependent

Drotein kinases (CDPK), SNF1 serine/threonine protein kinases mitogen-

CC activated protein kinases (MAPK), intermediate upstream mitogen-

CC protein kinases (MAPK), intermediate upstream mitogen-

CC protein kinases (MAPK), protein kinase.

(MAPKK). PKSRP is preferably protein kinase.

CC (MAPKK). PKSRP is preferably protein kinase.

CC crivated protein kinase-l (MAPK-l). PKSRP coding nucleic acid is useful

for producing transgenic plants, such as maize, wheat, rye, oat, rice,

crivated protein kinase-l (MAPK-l). PKSRP coding nucleic acid is useful

for producing transgenic plants, such as maize, wheat, rye, oat, rice,

crivated protein kinase-l (MAPK-l). PKSRP coding nucleic acid is useful

for producing transgenic plants, such as maize, wheat, rye, oat, rice,

crivated protein kinase-l (MaPK-l). PKSRP coding nucleic acid is useful

corount, perennial grass and forage crops with increased

coll palm, coconut, perennial grass and forage crops with increased

coll palm, coconut, perennial grass and forage crops with increased

coll palm, coconut, perennial grass, including drough, salinity or

temperature, as compared to a wild type variety of the plant. Sequences

       ò
                        The present invention relates to a PCR primer composition that specifically amplifies a 261 base pair DNA of Salmonella typhimurium. The composition comprises compounds MDH31 and MDH2. The primer composition is useful for detecting the presence of S. typhimurium in a sample. The present sequence is PCR primer MDH31 designed based on a gene encoding malic acid debyfrogenase (MDH) which is essentially involved in krebs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to gene sequences AAC83269 - AAC83276 which encode Escherichia coli H antigens. Also included in the invention is a method for the preparation of an B. coli H antigen, in which a gene encoding the antigen is introduced to a host E. coli, expressed and recovered. The H antigen is useful for the preparation of an antibody against a specific H antigen. The present sequence represents a PCR primer used in the isolation of DNA encoding the H antigens of the invention
                                                                                                                                                                                                                                                                                                                                                                                             PCR primer used specific for DNA encoding E. coli H antigens SEQ ID 19.

Novel transcription factor stress-related protein and nucleic acid encoding the proteins, for producing transgenic plants having increased tolerance to environmental stress including salinity, drought and Example 8; Page 69; 115pp; English. temperature.

drought, salinity or temperature, as compared to a wild type variety of the plant. TFSRP nucleic acid is also useful for increasing the expression of a gene of interest within a host cell as compared to a wild type variety of a host cell, by transforming the host cell with an expression vector comprising the TFSRP coding nucleic acid and expressing TFSRP in the cell. The environmental stress can also be metal, chemical, pathogenic and oxidative stresses or their combinations. TFSRP nucleic acid molecules, proteins, vectors and host cells are useful for identification and mapping of genomes of P. patens and related organisms, indentification and allocalization of P. patens sequences of interest, morning in the patens and contains the morning of the contains the c evolutionary and protein structural studies, determination of TFSRP regions required for function, modulation of a TFSRP activity, metabolism of one or more cell functions, transmembrane transport of one or more compounds and stress resistance. TFSRP protein and nucleic acid molecules expressing mutated The sequences given in AAC86072-81 are primers which were used to detect DNA's encoding transcription factor stress-related proteins (TFSRP's) from Physcomitrella patens as transgenes in transgenic plants. TFSRP's are used for conferring stress-tolerance in plants. The TFSRP's of the invention are selected from CAAT-box like binding factor (CABF), DNA binding factor (DBF), homeo domain/leucine zipper (HDZ), zinc-finger (ZF) and leucine zipper (LZ), preferably CABF-1, CABF-2, DBF-1, CRT/DRE binding factor-1 (CBF-1), HDZ-1, ZF-1, LZ-1, or their homologs. The nucleic acid encoding the TFSRP's are useful for producing transgenic plants, with increased tolerance to environmental stress, including plants, with increased tolerance to environmental stress, including also serve as markers for specific regions of the genome and to generate algae, ciliates, plants, fungi or other microorganisms expressing mutated TFSRP nucleic acid and protein molecules such that the stress tolerance is improved

Unionary and patent and the control of the compounds of the confidence of the conferring transcription factor stress-related proteins (TFSRP'S) from Physicomittella patens as transgenes in transgenic plants. TFSRP'S are used for conferring stress-tolerance in plants. The TFSRP'S of the invention are selected from CAAT-box like binding factor (CABF), DAM conferring stress-tolerance in plants. The TFSRP'S of the binding factor (DBF), homeo domain/Leucine zipper (HDZ), zinc-finger (ZF) binding factor—I (CBF), homeo domain/Leucine zipper (HDZ), zinc-finger (ZF) conferring factor—I (CBF), homeo domain/Leucine zipper (HDZ), ZF-1, ZF-1, CABF-2, DBF-1, CRY/DRE (ZF) conferring factor—I (CBF), HDZ-1, ZF-1, CABF-2, DBF-1, CRY/DRE (ZF) conferring the conferring transgenic conferring to a compared to a wild type variety of plants, with increased tolerance to environmental stress, including to the plant. TFSRP nucleic acid is also useful for increasing the expression of a gene of interest within a host cell as compared to a wild type variety of a host cell, by transforming the host cell with an expression of a gene of interest within a host cell as compared to a wild cype variety of a host cell, by transforming the host cell with an expression of a pene of interest within a host cell as compared to a wild cype variety of a host cell, by transforming the host cell for caid molecules, proteins, vectors and host cells are useful for identification and mapping of genomes of P. Patens and related organisms, identification and mapping of genomes of eller cells are useful for cellulation of a TFSRP activity, metabolism confinency and stress resistance. TFSRP protein and nucleic acid molecules compounds and stress resistance. TFSRP protein and nucleic acid molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequences given in AAC86072-81 are primers which were used to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               encoding the proteins, for producing transgenic plants having increased tolerance to environmental stress including salinity, drought and

   also serve as markers for specific regions of the genome and to generate algae, ciliates, plants, fungi or other microorganisms expressing mutated TFSRP nucleic acid and protein molecules such that the stress tolerance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a retrovirus of type C morphology, which sediments in a sucrose gradient at a density of 1.16-1.18 g/l. The retrovirus is infectious for canine cells and belongs to the oncovirinae group. The present sequence is a PCR primer for the retrovirus of the present invention. The retrovirus can be included in pharmaceutical

The present sequence is that of phosphorothioate oligonucleotide ISIS

(flanking the ATG start codon) of the human MADH6 mRNA sequence given in
AAH26681. A related chimeric oligonucleotide (ISIS 101971) has a "gap"

(C AAH26681. A related chimeric oligonucleotide (ISIS 101971) has a "gap"

(C AAH26681. A related chimeric oligonucleotide (ISIS 101971) has a "gap"

(C directions) by 5-nucleotides, flanked on both sides (5' and 3'

(C directions) by 5-nucleotide (wings, composed of 2' methoxytethyl (2'-MOE)

(C directions) by 5-nucleotide (wings, composed of 2' methoxytethyl (2'-MOE)

(C directions) by 5-nucleotide (wings, composed of 2' methoxytethyl (2'-MOE)

(C with the original oligonucleotide and 72# with the chimeric

(C oligonucleotide (ABDH6 (also known at MADH9 and SMAD9) is a putative

(C conjugnucleotide (ABDH6 (also known at MADH9 and SMAD9)) is a putative

(C conjugnucleotide are used to inhibit expression. Claimed antisense

(C oligonucleotides are used to inhibit expression of MADH6 in cells or

(C coligonucleotides are used to inhibit expression of MADH6 in cells or

(C tissues (claimed), as a means of treating an animal, particularly a

(C thuman, having or being prone to a disease or condition associated with

are replaced by 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a composition containing 4 dNTPs and at least one ddNTP and a thermally stable polymerase which incorporates ddNTPs into an extending nucleic acid polymer at a rate of not less than 0.4 times the rate of dNTP incorporation. This can be used with the PCR primers provided in the invention to detect the presence of microorganisms, such as Chlamydia trachomatis, HIV or human papillomavirus, in a sample. In addition, it can be used to detect mutations in a specific gene, to determine HLA type, and to produce sequencing fragments for further study
                                                                                                                                                                                                                                      Composition for detecting microorganisms, comprising deoxynucleotide triphosphates, dideoxynucleotide triphosphate, and thermostable polymerase to incorporate dideoxynucleotide triphosphate into extending

```
The present sequence is that of phosphorothioate oligonucleotide ISIS 101912, an antisense oligonucleotide targeted to nucleotides 39-58 (including the ATG start codon) of the human MADH6 mRNA sequence given in AAH26681. A related chimeric oligonucleotide (ISIS 101972) has a 'gap' region of 10 2'-deoxynucleotides, flanked on both sides (5' and 3' directions) by 5-nucleotide wings' composed of 2'-methoxyethyl (2'-MOE) nucleotides. The effects of these oligonucleotides on human MADH6 mRNA levels were determined by quantitative real-time PCR. Inhibition was 59% with the original oligonucleotide and 87% with the chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; Col 43; 34pp; English.

oligonucleotide. MADH6 (also known at MADH9 and SMAD9) is a putative member of a subgroup of SMAD family transcription factors which are regulated by bone morphogenetic proteins, and may be involved in signal transduction, growth inhibition and tumour suppression. Claimed antisense oligonucleotides are used to inhibit expression of MADH6 in cells or tissues (claimed), as a means of treating an animal, particularly a human, having or being prome to a disease or condition associated with MADH6 expression, e.g. to prevent, delay or treat infection, inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pyrophosphatase stress-related protein; PPSRP; pyrophosphatase-1;

PCR primers AAH42529-30 were used to amplify CDNA encoding a plant pyrophosphatase stress-related protein (PPSRP) in transgenic plants. PPSRP is a pyrophosphatase-1 (PPase-1). PPSRP is useful for increasing stress-tolerance in plants, and is obtained from Physcomitrella patens. PPSRP coding nucleic acid is useful for producing a transgenic plants with increased tolerance to environmental stress, including drought, pPSRP nucleic acid molecules, proteins, vectors and host cells are useful for identification and mapping of genomes of P. patens and related organisms, identification and localization of P. patens sequences of interest, evolutionary and protein structural studies, determination of PPSRP regions required for function, modulation of a PPSRP activity, metabolism of one or more cell functions, transmembrane transport of one Novel pyrophosphatase stress-related protein and nucleic acids for conferring increased drought, cold and/or salt tolerance to plants. more compounds and stress resistance Example 8; Page 52; 73pp; English. WPI; 2001-475787/51.

The invention relates to a marker for testing analogues of vitamin D expected to be effective in reducing aberrant activity of vitamin D-vitamin D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel marker for testing analogs of vitamin D expected to be effective in reducing aberrant activity of vitamin D-responsive cell, comprises gene pertinent to action of vitamin D for testing the analogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mechanisms. The invention is useful for testing compounds susceptible of inhibiting an enzyme which metabolises 1,25-dihydroxyvitamin D3. The invention is useful for treating epidermal wounds. The invention relates to a tumour necrosis-factor TNF inducible promoters. The invention is useful for identifying candidate TNF inducible promoters by aligning a test sequence consisting of a nucleic acid sequence with a comparison sequence selected from the invention, using a gap opening comparison sequence selected from the invention, using a gap opening penalty of 3 to define a test alignment, shuffling the nucleic sequence of the test sequence at least comparison sequences, aligning the randomised comparison sequences, aligning the randomised comparison sequence using a gap opening penalty of 50 sequences with the comparison sequence using a gap opening penalty of 50 sequences with the comparison sequence using a gap opening penalty of 50 sequences with the average alignment quality of the randomised alignments represent an alignment quality of the randomised colignment with the average alignment quality of the randomised alignment with the average alignment quality of the randomised alignment is obtained by chance as a candidate TNF of that the alignment is obtained by chance as a candidate TNF of that the alignment is obtained by chance as a candidate TNF compounds for treating or preventing autoimmune disorders or cancer. The compounds for treating or preventing autoimmune disorders or cancer. The present sequence is a primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an antisense compound (I), 16 to 30 bases in length targeted to specific base regions of a nucleic acid encoding the human Talin. Also described: (a) an antisense compound up to 30 bases in length which inhibits the expression of human Talin, (b) a composition of length which inhibits the expression of human Talin, (b) a composition of thuman cells or tissues comprising contacting the cells or tissues to vitro with (I) or (a). (I) has antiminarcobbal, antiminalmantory and cytoscatic activities, and can be used in antisense gene therapy and expression of human Talin in human cells or tissues; to prevent or delay infection, inflammation or tumour formation; and in diagnostics, therapeutics, prophylaxis, and in research reagents and kits. The present continent expresents a human Talin antisense chimeric phosphorothicate colligonucleotide, having 2'-methoxyethyl (2'-MOE) wings of 5 nucleotides at the 5' and 3' ends and all onucleotide decoxy gap in the middle, which is used in an example from the present invention
                                                                                                                                                                                     Human, Talin, antimicrobial, antiinflammatory, cytostatic, inhibitor;

The invention relates to an antisense oligonucleotide compound of 8 to 50 nucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibits the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6. The relation of caspase 6 in cells or tissues. The oligonucleotides can be administered therapeutically to prophylactically to treat an animal having a disease or condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a haematopoitic cancer, neurological conditions such as Alzheimer's disease and other decrease, neurological conditions such as Alzheimer's disease and other decreases the apportotic pathological conditions. This polynucleotide sequence represents a human caspase 6 oligonucleotide relating to the invention.

The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gane are modified, comprising modifying cells in which both alleles of a gane are modified, comprising modifying one allele by insertion or replacement by a cassette having an expression of selectable marker and modifying other allele by the combination, of a promoter replacement fragment with a heterologous recombination, of a promoter replacement fragment with a heterologous promoter. (MI) is useful for constructing a strain of diploid fungal colls in which both alleles of a gene are modified. The diploid fungal cells having both alleles of a gene are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (MI) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression. Sequences of the invention are useful for inhibiting the expression of HDA1 in cells or tissues and for treating an animal having a disease or condition associated with HDA1 e.g., hyperproliferative condition, which is cancer of haematopoletic, lymphoid, myeloid or breast or a condition resulting from a viral infection. Antisense compounds either alone or in combination with other antisense compounds or therapeutics can be used as Human; histone deacetylase 1; HDA1; enzyme; hyperproliferative condition; viral infection; prophylactic; inflammation; phosphorothioate backbone; tumour; antisense; cytostatic; virucide; ss. this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                translational, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of a histone hyperacetylating agent in the treatment of an autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   agents in the treatment of autoimmune diseases. In particular, they can be used to treat systemic lupus erythematosus (SLE), rheumatoid arthritis, Sjogren's disease, polymyositis and dermatomyositis. The present sequence is a PCR primer described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, autoimmune disease; systemic lupus erythematosus; SLB;

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary coligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Esterial monocytosens and pracunculus and praculus and praculus. Entamoeba histolytica and bracunculus medinesis. The method is also useful for detecting genetic diseases such that a general process and the food and also used for environmental monitoring, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, psis gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the method is also used infrared microscope) the support at the probese sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences is ABI85074 to

                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to gene sequences that are differentially expressed in eosinophils from patients with atopic dermatitis in the increment stage as compared with those in the remission stage. These sequences are used in a novel method for examining allergic diseases comprising determining the expression levels of these genes and comparing the expression level with that in the eosinophils of a healthy individual. The method of the invention may have antiallergic or individual. The method of the invention may have antiallergic of dermatological activities. The method can be used to diagnose allergic diseases particularly atopic dermatitis, and may also be used to screen candidate compounds for remedies. The method of the invention can be candidate compounds for remedies. The method of the invention can be represents a real time PCR primer specific for the differentially expressed atopic dermatitis related CDNA sequence 2298-09. This primer is used to quantify expression of the 2298-09 gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

The present invention relates to a new antisense compound targeted to a nucleic acid molecule encoding caspase 9 (C9). The compound specifically bybridises with and inhibits the expression of caspase 9. The invention calso describes an antisense compound that specifically hybridises with an active site of the nucleic acid. The invention sueful for inhibiting the expression of C9 in cells or tissues and is also useful for treating an animal having a disease or condition associated with C9, including a hyperproliferative, haematopolatic or cholesterol disorder, bone metabolism disorder, stroke, brain injury or neurodegenerative disease. The compound is commonly useful as a research and diagnostics reagent. It is also useful to distinguish between continuous of various members of a biological pathway. The invention is functions of various members of a biological pathway. The invention is clusten breferred over native form because of enhanced cellular uptake, confine merce of nucleases. The present nucleic acid target and increased stability in present of a collection (ABK69249-ABK69396) of chimeric phosphorochioate colligonucleotides having 2'-methoxyethyl (2'-MOE) wings. This sequence was in the methods of the invention for inhibition of caspase 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..
0
Antisense compound; caspase 9; C9; hyperproliferative disorder; stroke; haematopoietic disorder; cholesterol disorder; bone metabolism disorder; brain injury; neurodegenerative disease; infection; inflammation; tumour; phosphorothioate backbone linkage; 2'-methoxyethyl; 2'-MOE; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotide which modulates expression of caspase 9, useful to treat tumor, inflammation or to prevent infection in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated pol kappa76 polypeptide, a 76 kDa alternatively spliced variant of DNA polymerase kappa, useful as target for treating a patient with autoimmune disorder or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of human DNA polymerase pol kappa 76. The gene is found on human chromosome 5g12-13, in a head-to-head arrangement with the Goodpasture antigen binding protein (GPBP). The detection of the coding sequence can be used for diagnosing an autoimmune condition and identifying cells undergoing applotes, and the sequences can be used in the treatment of autoimmune described in the invention

The present invention relates to novel antisense oligonucleotides which specifically hybridise with specific regions of nucleic acids encoding interleukin-12 (IL-12) p35 subunit and inhibit the expression of human IL-12 p35 subunit. Sequences of the invention are useful for inhibiting the expression of human IL-12 p35 subunit in human cells or tissues and for treating animals, particularly humans suspected of having or being prone to diseases or conditions associated with expression of IL-12 p35 subunit. They are useful for diagnostics, therapeutics and as research formation or inflammation. Sequences of the invention are useful for antisense therapy. The present sequence is an antisense oligonucleotide targetted to human IL-12 p35 subunit DNA. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antisense compounds targeted to nucleic acids encoding interleukin-12 p35 subunit, useful for modulating interleukin-12 p35 subunit expression and treating diseases associated with expression of the

Sequences ADG90460-ADG90539 represent phosphorothicate targeted to the human talin gene, which inhibit its expression. The antisense were designed to target different regions of human talin RNA, and were analysed for their effect on talin expression by quantitative real-time PCR. Talin is a cytoplasmic protein which links cytoskeletal proteins such as actin, myosin and vinculin to integrins, thereby linking the extracellular matrix to other cells. It is thought to be involved in the regulation of cellular adhesion and cell morphology. Talin is highly expressed in platelets, and may play a role in platelet adhesion as its subcellular distribution differs between resting non-adhesive platelets and activated adhesive platelets. It could also play a major role in participate in the transmission of contractile force to the extracellular participate in the transmission of contractile force to the extracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          matrix in cardiomycoytes, and exhibits mechanical loading-dependent expression at myotendinous junctions. The expression of talin is downregulated by androgens in prostate tissues, a phenomenon known to contribute to the development of prostate cancer. The oligomucleotides of the invention are useful for diagnosis, prevention and treatment of talin related disorders, such as those related to cellular adhesion. The

The invention relates to a DNA or RNA construct capable of expressing interleukin (IL)-2 in a warm-blooded animal or biological preparation, comprising a Vpr activated promoter, a transcribable DNA segment coding for IL-2 and a secretory DNA encoding for a signal peptide functional in mammary cells and operably linked between the promoter and the DNA segment to facilitate secretion of IL-2. The construct is useful for increasing the immune response of a warm-blooded animal or biological preparation, by introducing the construct in stem cells, antigen preparation, by introducing the construct in stem cells, antigen preparation, by introducing the construct in stem cells, antigen presenting cells of the warm-blooded animal or biological preparation to obtain a calls, of the warm-blooded animal or biological preparation. The method is useful for stimulating immune response in immunocompromised patients. The method is useful for stimulating immune response in immunocompromised patients. The present sequence represents a divisor compromised patients. The present sequence represents a vprediven construct associated primer. Note: The present sequence is made to it
                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel DNA or RNA construct for increasing immune response of warm-blooded animal, has Vpr activated promoter, DNA segment encoding interleukin 2 and secretory DNA encoding signal peptide functional in mammary cells.
present sequence represents a human c-Ha-ras phosphorothioate antisense oligonucleotide used as a positive control in determining optimal oligonucleotide concentration for a particular cell line.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel compound of 8 - 50 nucleobases in length targeted to a nucleic acid molecule encoding a short heterodimer partner-1. The novel compound specifically hybridizes with a nucleic acid molecule encoding the short heterodimer partner-1, and inhibits the expression of the nucleic acid molecule. The compound, and a composition comprising it are useful for treating a disease or condition associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   with the short heterodimer partner-1, particularly a condition involving abnormal lipid or cholesterol metabolism such as atherosclerosis or a cardiovascular disease. They are also useful in research and diagnostics for modulating the expression of short heterodimer partner-1. They can also be useful prophylactically in preventing or delaying infection, inflammation or tumour formation. This polynucleotide sequence represents a mouse antisense oligo relating to the heterodimer partner-1 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Wew antisense oligonucleotide targeted to a nucleic acid encoding short

New antisense compound, useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel antisense compound, which is 8-30 mucleobases in length targeted to a nucleic acid molecule encoding p38 mitogen-activated protein kinase (MapK). The products of the invention have antiarthritic and antiinflammatory activity, can act as act as kinase inhibitors. The antisense compound is useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis or for use in antisense gene therapy. This sequence represents an antisense oligonucleotide used in a method to
                                                                                                                                                                                                                                                                      /note= "nucleotides 1-5 & 16-20 are 2'-methoxyethoxy (MOE) nucleotides, nucleotides 1-4 & 16-19 are linked via phosphodiester linkages, nucleotides 6-15 are 2'-deoxy- nucleotides, nucleotides 5-16 are linked via phosphorothioate linkages, all C nucleotides are 5-methyl cytosines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to an isolated nucleic acid molecule which encodes a tumour rejection antigen precursor (TRAP) having an amino acid sequence of a TRAP encoded by a fully defined MAGE-C3, MAGE-B5, or MAGE-B6 polynucleotide sequence. Also disclosed is a method which is useful for determining presence of cytolytic T-cells specific for complexes of human leutocyte antigen (HLA) and a peptide derived from the nucleic acid in a cytotoxic T-lymphocyte (TLM) containing sample. The nucleic acid is useful as a diagnostic probe to determine the presence of abnormal cytomoxic cells escention, breast carcinoma, sercoma, head-and-neck squamous-cell carcinoma, breast carcinoma, sarcoma, cutaneous melanoma or nonsmall cell lung cancer (NSCLC) which express MAGE-C1, MAGE-B5 or MAGE-B6. The nucleic acid is useful for diagnosing a disorder characterised by expression of MAGE-C1, MAGE-B5 or MAGE-B6. The nucleic acid is useful for diagnosing or tumour rejection antigens (TRAS). The present sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Abscisic acid-inducible and stress responsive protein; ASR; A22; PKABA; stress inducible cysteine protease; late embryogenesis abundant protein; LBA; dehydrin; DHN; abscisic acid-induced protein kinase; gene therapy; CYS; seed development; plant tolerance; germination; plant protectant; PCR; primer; ss.
                                                                                                                                                                                                                                                               Novel isolated nucleic acid encoding tumor rejection antigen precursor MAGE-03, MAGE-B5, or MAGE-B6, useful as diagnostic probes to determine presence of abnormal e.g., tumor cells expressing MAGE-C1, MAGE-B5 or MAGE-B6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Arabidopsis thaliana gene amplifying reverse PCR primer #14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.8%; Score 13.4; DB 1; Length 20; 93.3%; Pred. and/or germination, development, maturation, and modifying a plant developmental process. They are also useful for modifying plant tolerance and adaptation to stresses and adverse environmental stimuli. The invention is also used in gene therapy. The present sequence is a PCR primer used for amplifying Arabidopsis thaliana gene. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to nucleic acid encoding abscisic acid-inducible and stress responsive proteins (ASR and A22), stress-inducible cysteine proteases (CXS), late embryogenesis abundant proteins (LBA), debydrins (DHN) and abscisic acid-induced protein kinases (PKARA). The invention also relates to a method for modification of plant and seed development and plant responses to stresses and stimuli. The invention is useful as molecular genetic markers. The method is useful for modifying plant response to an environmental stimulus, modifying plant tolerance to abilitic, osmotic and/or temperature stresses, modifying seed dormancy abilitic, osmotic and/or temperature stresses, modifying seed dormancy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids having higher expression in human neuroblastoma with poor prognosis for diagnostic prediction of neuroblastoma prognosis.
                                                                                                                                                                             wew isolated nucleic acid encoding ASR, A22, CYS, LEA, DHN or PKABA proteins, useful as molecular genetic markers, and in modifying plant and/or seed development and responses to stresses and adverse environmental stimuli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Neuroblastoma; prognosis; spontaneous regression; primer; probe; ds;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 3 A; 6 C; 6 G; 5 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neuroblastoma-related oligonucleotide #293.

                                    The invention comprises nucleic acids that show increased expression in human neuroblastroms with poor prognosis over those with a good prognosis. The nucleic acids of the invention are useful as a tool for distinguishing neuroblastoms with a favourable prognosis (spontaneous tregression) from neuroblastoms with a poor prognosis (spontaneous The DNA sequences ABT32224 - ABT32571 represent oligonucleotides used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ds; NF-kappaB essential modulator; nuclear factor kappa B; incontinentia pigmenti; X-linked disorder; chromosome Xq28; NEMO; immunomodulatory; dermatological; osteopathic; neuropathic; apoptosis-related disease; immune-system related disease; blood vessel-related disease; skin defect; dental defect; osteopetrosis; ophthalmologic defect; neurological defect.
                                                                                                                                                                                                               Gaps

method for determining the relative copy number of a group of target nucleic acid molecules present in a sample. The method comprises: (1) performing a first PCR in a PCR mixture; (2) performing a second PCR in taxture; (2) performing a second PCR in a PCR mixture; (2) performing a second PCR in a sample mucleic acid product present in the sample containing the target nucleic acid molecule. Also described: (1) quantifying the copy number of a group of target nucleic acids in a sample; and (2) determining whether a subject is at risk of acquiring Alzheimer's disease. The method is useful for determining the relative copy number of a group of target nucleic acid molecules present in a sample for determining whether a subject is at risk of acquiring Alzheimer's disease. ACC99620 to ACC99730 represent PCR primer used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                           The invention relates to a nuclear factor-kappa B (NF-kappa B) related medical condition in an organism being detected by obtaining a sample condition in an analysing the sample for an alteration in a the nuclear factor kappaB essential modifier (NEMO) gene or protein sequence nuclear factor kappaB essential modifier (NEMO) gene or protein sequence (neither shown in the specification). The alteration results in the contraction of NF-kappa B. Also included are treating or preventing NF-kappa B ralated medical condition in an organism by administering the compound to the organism and screening a test organism for a compound for the treatment of NF-kappa B related medical condition. The method improvement in the NF-kappa B related medical condition, e.g. incontinential consecul is for detecting NF-kappa B related condition, e.g. incontinential compensation of the organism in the method consecul-related disease, immune-system related disease, blood vessel-related disease, skin defect, dental defect, osteopetrosis, ophthalmologic defect, or neurological defect, in an organism, i.e. human including affected individual, carrier individual, or noncarrier individual. The NEMO gene is located on chromosome Xq28, incontinential incontinential pieng an X-linked disorder. Experiments in this study show contactions in a son 2, 10, 9 and particularly intron 3 to be linked to the acceptor site from the human NEMO gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó

The invention relates to a microorganism detecting composition. The composition is used for detecting a target microorganism. It is used in a bl-directional DNA sequencing method in several contexts including detection of mutations, particularly mutations of medical significance, in samples derived from a human patient, animal, plant, or microorganism; Microorganism detecting composition comprises dideoxynucleotide triphosphate(s) corresponding to one of four deoxynucleotide triphosphate, and thermally stable polymerase enzyme. New isolated DNA polymerase, pol kappa 76, useful in identifying autoimmune disorders and in treating cancer and autoimmune disorders by modifying its expression.

Example; Page 7; 54pp; English.

The invention relates to an isolated pol kappa (k) 76 polypeptide (an ABD01321 (encoded by the cDNA polymerase kappa), appearing as ABD01327 (encoded by the cDNA appearing as ACD13492). The gene for POLKappa is located on chromosome 5q12-13 in a head-head arrangement the gene encoding Goodpasture antigen binding protein (GDBP or collagen 4 alpha 3 binding protein (GOLAA3bp), associated with autoimmune diseases such as Goodpasture's disease and cutaneous lupus) i.e. has a bi-directional promoter. Also included are a recombinant expression vector comprising the polK76 CDNA, a host cell transfected with the vector, detecting (M1) polK76 (comprising providing a protein sample to be screened, contacting the protein sample to be screened with an anti-

complexes, where the presence of the antibody-polypeptide complexes indicates the presence of polyffs), detecting (M2) the polkfs mucleic acid in a sample (comprising contacting the sample with one or more polkfs PCR polkfs), especialty of effecting an autoimmune condition in a patient comprising providing a tissue or body fluid sample from the patient, providing a control tissue or body fluid sample in which no autoimmune condition is present, and detecting an increase in pol kfs RNA expression in the tissue of body fluid samples compared to the control sample, where the increase indicates the presence of an autoimmune condition) and condition as patient with an autoimmune disorder or cancer by modifying the expression or activity of polkfs in the patient. Modifying the expression or activity of polkfs or polkfs nucleic acid, such as by increase the present sequence is a PCR and/or sequencing primer used in the present sequence is a PCR and/or sequencing primer used in charmaly applied to the reaction or activity and an autoimmune disorder or cancer. The present sequence is a PCR and/or sequencing primer used in the analysis of bi-directional promoters of conter genes (and/or of the analysis of bi-directional promoters of contergence and to the antibody and detecting the formation of an antibody- polypeptide whose structure and sequence were compared to the polkappa/GPBP bi-directional promoter polkappa/GPBP)

The compound specifically hybridises with the nucleic acid molecule encoding
promoters, expression vectors and host cells are useful for identifying promoters that are regulated by tumour necrosis factor or for identifying candidate compounds for treating or preventing autoimmune disorders or cancer. This sequence represents a PCR primer used for isolating a tumour necrosis factor inducible promoter of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ŋ

The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA cragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo, and a microarray equipped with the SNP containing oligo. The isolated human compact the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent of the invention and some is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents one of the properties in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotide useful for detecting single nucleotide polymorphisms

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel nucleic acid that encodes the polycystic kidney and hepatic disease 1 (PKHD1) polyceptide. It has been identified that a mutation in the PKHD1 gene is associated with autosomal recessive polycystic kidney disease (ARPKD), which is characterised by enlarged kidneys and congenital hepatic fibrosis, and is most commonly observed in children and infants. The present invention describes the identification of the PKHD1 gene, mapped to human chromosome 6p21.1-p12, and splice variants thereof. The PKHD1 polymucleotides and polypeptides are useful in diagnostic testing and for developing targeted therapeutic interventions for patients with ARPKD. Furthermore, they exhibit nephrotropic activity and are involved in the regulation of cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense compounds, compositions and methods for modulating the expression of Sonic hedgehog (SHH). The composition comprises antisense compounds targetted to SHH. The antisense compound is used to inhibit the expression of SHH in cells or tissues and to treat an animal having a disease or condition associated with SHH, such as cancer, an autoimmune disease or an inflammatory disorder. It is also useful in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells and tissues. The antisense compounds are useful in antisense gene therapy. The present sequence is an antisense oligonucleotide targetted to human SHH DNA. This sequence is used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New compound for inhibiting Sonic hedgehog (SHH) expression in cells or tissues and for treating an animal having a disease or condition associated with SHH, such as cancer, an autoimmune disease, or an

The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs existing in human genes and for the diagnosis of human disease. The present DNA sequence represents a human gene PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, antisense; lung dysfunction; nasal airway dysfunction, antinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antilnflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a serventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antilnflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition, lung inflammation, but was obtained in electronic format directly from WIPO and formation, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                 Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          at ftp.wipo.int/pub/published_pct_sequences

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory steroid and ubiquinone, A composition of the invention has antiinflammatory steroid and encomposition is useful for treating or preventing a respiratory, and cytostatic activity. The composition may have a composition a batisense gene therapy. The composition is useful for treating or preventing a respiratory through or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing pronchodilation, increasing levels of ubiquinone or coepitor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allerigies, or a respiratory disease or condition, lung allerigies, or a respiratory disease or condition.

Chose the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO construction.

The sequence of the sequence of the sequences are fire, who int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation cooden, cooling regain, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 muclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entilnflammatory steroid and ubiquinone. A composition of the invention has antilnflammatory, antiallergic, antiasthmatic, hypotensive, consumptions and cytostatic activity. The composition may have a immonsuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory also for antilnflammatory steroid in a subject, for reducing or depleting levels of intringlammatory steroid in a subject, for reducing levels of receptor, producing procholation, increasing levels of adenosine or receptor, producing procholation, increasing levels of definition of the subject, for reducing levels of increasing levels of definition and the subject, for reducing levels of increasing levels of definition and the subject, for reducing levels of encountering the procholation of the respiratory definition, increasing levels of definition of the definition of the definition of the respiratory definition of the respiratory definition.
                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchodonstriction; lung allergy; lung inflammation; respiratory disease; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
   The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitlemmatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing levels of depleting levels of or receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, or a respiratory disease or condition. Once: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiatethmatic; thypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchodilation; bronchodilation; lung allergy; lung inflammation; respiratory disease; ds.

The invention relates to identifying at least one gene that is consistently expressed across different cell or tissue types in an organism. The method involves preparing gene expression profiles for different cell or tissue types, calculating a variation coefficient for types, and selecting any gene whose coefficient indicates that the gene is consistently expressed across the cell or tissue types. The methods and compositions of the present invention of quantitative nucleic acid detection assays, are useful in medical and biotechnological research and development, diagnostic testing, drug development and forensics. The present expressing a PCR primer specific for the sorting nexin 3 Identifying at least one gene expressed across different cell or tissue types by monitoring control genes, useful in medical and biotechnological research and development, diagnostic testing, drug development and Sequence 20 BP; 8 A; 5 C; 5 G; 2 T; 0 U; 0 Other; present sequence represents a PCR primer egene, used in the course of the invention Disclosure; Page 41; 48pp; English. The invention traders to methods for the invention or predicting metastasis. The methods involve determining whether a neoplastic growth marker protein is overexpressed, either by the use of an antibody specific for the protein, or by the use of PCR or hybridisation to detect noteic acids encoding the marker proteins. A set of neoplastic growth notes are disclosed (SAGE (serial analysis of gene expression) tags for these are given in ADA26759-ADA26759, with protein tyrosine phosphatase type IVA member 3 (also known as PRL-3) being a preferred neoplastic growth marker. The neoplastic growth markers are specifically expressed at a higher level in metastatic cancers, compared with advanced and early stage cancers and normal cells from which the cancer is derived.

Overexpression of the neoplastic growth markers is taken as an indication overexpression of the neoplastic growth markers is taken as an indication concer, and for identifying candidate drugs for treating advanced or metastatic cancers. The methods of the invention are useful for identifying regions of neoplastic growth, for detecting or predicting metastasis, or identifying candidate drugs for treating advanced or metastatic cancers. The methods of the invention are useful for identifying regions of neoplastic growth, for detecting or predicting metastasis, or identifying candidate drugs for treating advanced or metastatic cancers. The methods of the invention are useful for identifying regions of neoplastic growth, for detecting or predicting metastasis, or identifying regions of neoplastic growth, for detecting or predicting metastatic cancers. The methods of the invention are useful for metastatic cancers. The methods of the invention are useful for metastatic cancers in the invention is particularly applicable to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to an antisense oligonucleotide 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic actid molecule encoding a p38 mitogen activated protein kinase (WAPK), where the antisense compound inhibits the expression of the p38 MAPK. The antisense oligonucleotide is useful for inhibiting the expression of p38 MAPK, in cells or tissues. It is also useful for treating an animal having a disease or condition associated with p38 MAPK, e.g. an inflammatory or an autoimmune disease (e.g. rheumatoid arthritis) or a heart disease. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents a p38 MAPK antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiakhamtic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides for modulating p38 mitogen activated protein kinase (MAPK) expression, useful for diagnosing, preventing or treating diseases associated with p38 MAPK, e.g. inflammation or heart

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, contractant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition analgesic, hypotensive, immunosuppressive and cytostatic activity, is a cangesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The contraction and/or lung 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pulmonary obseruction, analy or provident the proproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and

WPI; 2003-093058/08.

Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 7253; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a marmal. The coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dystunction also describes a kit, that comprises: (a) a delivery construction also describes a kit, that comprises: (a) a delivery construction also describes a kit, that comprises: (a) a delivery construction for adding a carrier and for use of the kit. The composition instructions for adding a carrier and for use of the kit. The composition of the invention has antialergic, antiinflammatory, antiatiathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascoonstriction, confirmation, allergies, asthma, impeded respiration; pulmonary disease, pulmonary treaghrancy pulmonary pain, cystic fibrosis, allergic rhintis, pulmonary contension, emphysema, chronic obstructive pulmonary disease, pulmonary contension, emphysema, chronic obstructive pulmonary disease, pulmonary contension, emphysema, content of the anti-sense oligons content of the pulmonary observent the breakdown of the oligonucleotides into products that free adenosine content of the view of products that free adenosine content of the origi e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pullmonarty obstruction, and/or bronchoconstriction and/or lung pullmonarty obstruction, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.
                                                                                                                                                                                                                                                  respiratory tract inflammation; adenosine sensitivity, lung; cancer; surfactant depletion; antiallergic; antinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel composition (a) a first active agent,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Miller S,
                                                                                             ABD23272;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nyce JW,
RESULT 2367
```

```
surfactant depletion or hyposcretion, when administered to a mammal. The oligonacleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonacleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or mailgnant disease. The administered composition comprises oligo and is administered to reduce the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    respiratory tract inflammation; adenosine sensitivity, lung, cancer; surfactant depletion; antiallergic, antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrensgic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          receptors
 tissue environment and thereby,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel composition (a) a first active agent,
                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                        antisense; bronchoconstriction; allergy; hyposecretion; pain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and

with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 7974; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) adelivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a cetaring a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary vasoconstriction, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary disease, pulmonary conditions when as pulmonary disease, pulmonary of hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary cransplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the system of the oligonucleotides into products that free adenosine into the system of the oligonucleotides into products that free adenosine into the system of prevent any unwanted effects due to it ö surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.                                          ð
                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a compound targeted to and which specifically hybridises with a nucleic acid molecule encoding VEGF-C, and inhibits the expression of VEGF-C. The compound, composition and methods are useful for treating a disease or condition associated with VEGF-C, such as a cardiovascular disorder e.g. atherosclerosis or diabetic retinopathy or an autoimmune or inflammatory disorder. They are also useful in research and diagnostics for modulating the expression of VEGF-C. The present sequence represents a human VEGF-C antisense oligonucleotide.

The present invention relates to antisense compounds targeted to a nucleic acid encoding beta-site APP-cleaving enzyme 2. The antisense compound comprises an antisense oligonucleotide that specifically compound comprises an antisense oligonucleotide that specifically approached the expression of beta-site APP-cleaving enzyme 2. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified sugar moiety, preferably a 2'-Or it also comprises at least one modified sugar moiety, preferably a 2'-Or methoxyethyl (2'-MOB) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 2'-Or methylyctosine. The antisense oligonucleotides are useful for the comprises such as hyperproliferative disorders, e.g. cancer, treatment of diseases such as hyperproliferative disorders, e.g. cancer, and neurodegenerative disorders such as Alzheimer's disease. The present sequence represents a human beca-site APP-cleaving enzyme 2 DNA target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding beta-site APP-cleaving enzyme 2 useful for treating a disease or condition, e.g. cancer, Alzheimer's disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention relates to antisense compounds targeted to a nucleic acid encoding beta-site APP-cleaving enzyme 2. The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of beta-site APP-cleaving enzyme 2. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as hyperproliferative disorders, e.g. cancer, and neurodegenerative disorders such as Alzheimer's disease. The present sequence represents an antisense oligonucleotide used in the examples of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding beta-site APP-cleaving enzyme 2 useful for treating a disease or condition, e.g. cancer, Alzheimer's disease or neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                 /note= "This oligonucleotide has a phosphorothioate backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 5 nucleotides in length at each end. All extidine residues are 5-methyloytidines.
                                                                                                                 Human beta-site APP-cleaving enzyme 2, antisense oligonucleotide #9.

The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL-3), that specifically hybridises with the nucleic acid encoding PRL-3 and inhibits expression of PRL-3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of PRL-3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with PRL-3 and screening for an antisense compound. The antisense oligonucleotide is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotide, comprising a sequence targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PR-3), useful for preparing a composition for treating hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         useful for preparing a composition for treating hyperproliferative disorder, particularly cancer ((e.g. colorectal cancer), diabetes, reduced glucose tolerance, insulin resistance and obesity. This invention relates to a novel DNA molecule which comprises a DNA molecule made up of the following elements in a 5' to 3' direction: a first restriction endonuclease site; a T3 promoters site; at least on Tag gene comprising at least 5 20mer Tag sequences; a Poly A site having at least 21 consecutive A residues; a second restriction endonuclease site having at endonuclease site; or a T7 Promoter than the first restriction endonuclease site; or a T7 Promoter on the opposite strand as the T3 promoter. The invention may be useful in mucleic acid analysis, in promoter, The invention may be useful as assay controls, in assay development, product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New DNA molecules made by annealing and extending overlapping 60mer oligonuclectides, useful in producing synthetic Tag genes useful as assay controls, in assay development, product development and for quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  restriction endonuclease site; T3 promoter site; Tag gene; Poly A site; T7 Promoter; nucleic acid analysis; synthetic Tag gene; assay control; assay development; product development; product validation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL-3), that specifically hybridises with the nucleic acid encoding PRL-3), that specifically hybridises with the nucleic acid encoding PRL-3 and inhibits expression of PRL-3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of PRL-3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with PRL-3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotide, comprising a sequence targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL -3), useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer.
                                                                                                                                                                   1. 20

                                                                                                                                                                                                                                                                                                                                                                       New DNA molecules made by annealing and extending overlapping 60mer oligonucleotides, useful in producing synthetic Tag genes useful as assay controls, in assay development, product development and for quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               molecule made up of the following elements in a 5' to 3' direction: a first restriction endonuclease site; a T3 promoters site; at least one Tag gene comprising at least 5 20mer Ts sequences; a Poly A site having at least 21 consecutive A residues; a second restriction endonuclease site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          which may be the same or different than the first restriction and and another leaves site, or a T7 Promoter on the opposite strand as the T3 promoter. The invention may be useful in nucleic acid analysis, in particular to synthetic Tag genes useful as assay controls, in assay development, product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel DNA molecule which comprises a DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0

The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "OTHER = Bases 1-5 and 16-20 comprise 2'-methoxyethyl (2'-MOE) wings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleic acid encoding protein tyrosine phosphatase receptor type alpha (PTPRA), useful for treating hyperproliferative or metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PTPRA; protein tyrosine phosphatase, receptor type alpha; LCA-related phosphatase; LRP; HLPR; HPTPA, PTPRL2; PTPTPA, CYTOSTATIC; ANPERIORIC, TAPTPA, CYTOSTATIC; ANPREPROJIC-REPTPA, CYTOSTATIC; AND MINIORIC AND WING; 2'-methoxyethyl gapmer; phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel compound 8-80 nucleobases in length which is targeted to and specifically hybridises with a nucleic acid molecule encoding PTPRA (protein tyrosine phosphatase, receptor type alpha, LCA-related phosphatase; LRP; HLPR; HPPR, PTPRL; RPPRL) and inhibits the expression of PTPRA. The compound of the invention
Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New compounds, particularly antisense oligonucleotides targeted to a

polynucleotide by determining subsets of composite subsequences present in nucleic acid subsamples generated from the sample polynucleotide. A harbynin primer interrogates the composite subsequences in a two-step process resulting first in a polymerase extended product whose synthesis identifies the first subsequence of the composite subsequence. The second subsequences are identified by hybridising the polymerase extended products or amplified products thereform to an array of capture probes wherein each capture probe is positionally distinguishable from other capture probes. The method is useful for sequencing a polymucleotide on a generic gene chip. The invention is useful for identification and quantitative determination of the presence of nucleic acids in a sample, in particular to methods of genomic analysis, for identifying differences
a 2'-O-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as autoimmune disorders e.g. multiple sclerosis, infections, and atherosclerosis. The present sequence represents an antisense oligonucleotide used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying and quantifying a nucleic acid in a sample, by providing subsequence sets present in the sample, useful e.g. for analyzing differential nucleic acid expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 generic gene chip; diagnosis; genomic analysis;

The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of complement component C3 in cells. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably
 demonstrates cytostatic activities and may be useful for treating a disease or condition associated with PTPRA, such as a hyperproliferative disorder or metabolic disorder, as well as in research and diagnostics for modulating the expression of PTPRA. The current sequence is that of an antisense 2' MOB (2'-methoxyethyl) gapmer oligonucleotide which was targeted to human PTPRA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense therapy; mouse; complement component C3; autoimmune disorder; multiple sclerosis; infection; atherosclerosis; neuroprotective; antiarteriosclerotic; antimicrobial; antiinflammatory; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /mod_base= OTHER

in the relative abundance of nucleic acids in a mixture of nucleic acids, and generally to diagnostic aids for analysing nucleic acid composition and content of biological samples, e.g. medical and agricultural. The method can be applied to gene expression analysis by identifying and quantifying cDNA. The method is rapid and cost effective. The present sequence is a detector oligonucleotide used in an exemplification of the Gaps ; 0 Length 20; 1; Indels Sequence 20 BP; 6 A; 6 C; 6 G; 2 T; 0 U; 0 Other; 0.8%; Score 13.4; DB 1; 93.3%; Pred. Human; VEGF co-regulated chemokine-1; VCC-1; vascular endothelial growth factor; ss, antisense compound; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; antisense oligonucleotide; diabetes; immunological disorder; cardiovascular disorder; neurological disorder; cardiovascular disorder; neurological tisorder; ischaemia; reperfusion injury; cancer; angiogenic disorder; haemangioma; tumour angiogenesis; rheumatoid arthritis; artherosclerosis; psoriasis; fibrosis; myocardial infarction; wound healing; bone fracture; cartilage damage; tissue regeneration; organ regeneration; periodontal disease; gut regeneration; atrial fibrillation. Human VEGF co-regulated chemokine-1 DNA antisense oligonucleotide #473.

(VCC-1), New antisense compounds targeted to a nucleic acid molecule encodin ascular endothelial growth factor co-regulated chemokine-1 (VCC-1) useful for treating VCC-1-associated disorders, e.g. diabetes or a neurologic disorder.

Claim 4; SEQ ID NO 473; 336pp; English.

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VEGF) coregulated chemokine-1 (VCC-1), and which specifically hybridieses with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1 in cells or tissues compound and a method of treating the or tissues with the antisense compound and a method of treating a human having a disease or condition associated with VCC-1 comprising administering the antisense compound to an animal to inhibit expression of VCC-1. The antisense oligonucleotide comprises at least one modified

internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0- methoxyethyl sugar moiety, and at least one modified nucleobase, specifically a 5-methyloytosine. The antisense oligonucleotide preferably is a chimeric oligonucleotide. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, an immunological disorder, a cardiovascular disorder, a neurological disorder, a cardiovascular disorder, a neurological disorder, a paemangioma, tumour angiogenesis, rheumatoid arthritis, atherosclerosis, psoriasis or fibrosis after myocardial infarction. VCC-1 antisense oligonucleotides may also be used for wound healing, for conditional periodontal diseases, for gut protection or regeneration, for treating periodontal diseases, for gut protection or regeneration, for treatment of lung or liver fibrosis or for management of atrial fibrillation. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human VCC-1 polypeptide the invention. 888888888888888888888888

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VEGF) coregulated chemokine-1 (VCC-1), and which specifically hybridises with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1 in cells or tissues comprising contacting the cells or tissues with the antisense compound and a method of treating the antisense compound to an animal to inhibit expression of varing a disease or condition associated with VCC-1 comprising a human conformation of varing the antisense oligonicleotide comprises at least one modified comprises at least one modified sugar molety, preferably a 2'-0-comprises at least one modified sugar molety, preferably a specifically a 5-methyloytosine. The antisense oligonucleotide preferably specifically a 5-methyloytosine. The antisense oligonucleotide preferably is a chimeric oligonucleotide. The antisense oligonucleotide preferably is a chimeric oligonucleotide. The antisense oligonucleotide preferably is meaning a disease or condition associated with VCC-1, such as diabetes, and the companies of the companies of the condition associated with variable of the condition of the condition of the condition of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VEGF) co-cregolated chemokine—I (VCC-1), and which specifically hybridises with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1 in cells or tissues comprising contacting the cells or tissues with the antisense compound and a method of treating a human contacting the antisense compound and animal to inhibit expression of VCC-1. The antisense compound to an animal to inhibit expression of VCC-1. The antisense objected comprises at least one modified comprises at least one modified sugar molecty, preferably a 2'-O-creptically a 5-methylotycosine. The antisense compound is useful for specifically a 5-methylotycosine. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, specifically a 5-methylotycosine. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, an immunological disonder, a cardiovascular disonder, ischaemia, reperfusion injury, cancer or an angiogenic disorder, e-g. haemangioma, tumour angiogenesis, rheumatoid arthritis, atherosclerosis, psociatis or tibrosis after mycardial infarction. Cantisense oligonucleotides may also be used for wound healing, for teating experience of tissues or organs, for treatment of lung or liver fibrosis or for management of atrial fibrillation. This sequence represents an antisense collagonical colling the human VCC-1 polypeptide of that invention
                                                                                                                                                                                                                                                                                                               New antisense compounds targeted to a nucleic acid molecule encoding vascular endothelial growth factor co-regulated chemokine-1 (VCC-1), useful for treating VCC-1-associated disorders, e.g. diabetes or a

The present sequence is that of PCR primer P2 for the rice histone deacetylase OsHAAC3 gene. Primers P2 and R2 ADM41527 were used in the PCR amplification of OsHDAC3 cDNA ADM41520 to generate a 249 bp probe ADM41528. The probe was used to search for the corresponding gene in a rice genome library. The invention provides a method for producing a plant having a high growth rate. This involves transforming a monocot plant, especially rice, barley, wheat or maize, with a recombinant oblasmid containing a gene ADM41518-ADM41520 encoding OsHDAC1, OsHDAC2 or OsHDAC3 ADM41530-ADM41530. OsHDAC proteins change the structure of chromatin to increase or decrease the expression of a foreign gene, so that the expression level of OsHDAC proteins can be controlled to produce a plant having varied phenotypic characteristics. Plants can be produced that have a high growth rate under stress conditions, such as drought and cold, as well as under normal conditions. chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; implibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antidiflammatory; neuroprotective; antidiflammatory; neuroprotective; notropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se. New protein OsHDAC1, OsHDAC2, or OsHDAC3, having a function of histone deacetylase (HDAC), useful for producing a plant with high growth rate.                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to of 404.3. The present invention also describes: (1) antisense compounds, sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal adisease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, cophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound to be used as mPGES-1 inhibitors and in gene therapy. The antisense compound to condition associated with mPGES-1 e. G., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or optital in immunological, cardiovascular or neurological disorder.

The invention relates to a method of detecting a biological condition associated with a dominant laminin A (LMNA) mutation in a subject comprising determining whether a subject has mutation in LMNA, and where the mutation comprises a variant nucleic acid sequence in or corresponding to codon 608, 644, 145, 471, 527 or 269 of human LMNA, or two or more mutations. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with the mutation of LMNA, such as progeroid disease that is Butchinson-Gilford progeria Syndrome, or arteriosclerosis or atherosclerosis. This sequence corresponds to a primer used in a microsatellite analysis of chromosome 1921.3-23.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ss; antidiabetic; immunosuppressive; cardiovascular; antilipemic; antiarteriosclerotic; hepatotropic; litholytic; anorectic; eneuroprotective; vasotropic; antisense; gene therapy; Farnesoid X receptor; diabetes; immunological disorder; cardiovascular disorder; dyslipidemia; atherosclerosis; high density lipoprotein; low density lipoprotein; hypertolesterolesis; pallstones; hypertriglyceridemia; obesity; neurological disorder; ischemia; reperfusion; diagnostics; prophylaxis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting a biological condition associated with a dominant laminin A (LMNA) mutation, useful for diagnosing, preventing or treating a progeroid disease that is Hutchinson-Gilford Progeria Syndrome, and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Farnesoid X receptor gene expression antisense inhibitory oligo #1663.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                            The invention relates to an antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atheroselerosis, low HDL (high density lipoprotein), elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertriglyceridemia, obesity, newrological disorders, or ischemia/reperfusion injury. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence corresponds to an antisense oligonucleotide of the
